6. a) For the circuit below, what is the terminal voltage of the battery?

$$
\begin{aligned}
R_{\text {parallel }} & =5.0 \Omega \\
R_{\text {total }} & =9.0 \Omega \\
I_{\text {total }} & =\frac{V}{R}=\frac{12.0}{9.0}=1.33 \mathrm{~A} \\

V_{\text {terminal }} & =12.0-5.3=6.7 \mathrm{~V} \quad \leftarrow \mathbf{4} \text { marks }
\end{aligned}
$$

b) If resistor $R$ is added in parallel to the circuit as shown, what is the effect on the terminal voltage?

c) Using principles of physics, explain your choice for b).

Additional $R$ in parallel results in an overall lower $R$, thus an increase in current. ( 2 marks) As a consequence, a greater voltage drop Ir occurs across the internal resistance resulting in a smaller terminal voltage. ( 2 marks)
7. A 0.120 m diameter coil consisting of 200 loops is placed in a 0.35 T magnetic field. The magnetic field is changed to 0.25 T in the opposite direction in 0.80 s .

Initial

Final

What is the magnitude of the current through the $33 \Omega$ resistor connected to the coil? (Ignore the resistance of the coil.)

$$
\begin{aligned}
\mathcal{E} & =\frac{-N \Delta \Phi}{\Delta t} & & \leftarrow \mathbf{1} \text { mark } \\
& =\frac{200 \cdot(0.25-(-0.35))\left(\pi \cdot 0.060^{2}\right)}{0.80} & & \leftarrow \mathbf{2} \mathbf{~ m a r k s} \\
& =\frac{200 \cdot 0.60 \cdot 0.0113}{0.80} & & \leftarrow \mathbf{1} \text { mark } \\

\end{aligned}
$$

8. A conducting loop is pulled at various speeds through a region of constant magnetic field strength.

A student measures the potential difference across the resistor in the loop for each trial and records the following data.

| POTENTIAL DIFFERENCE $(\mathrm{V})$ | SPEED $(\mathrm{m} / \mathrm{s})$ |
| :---: | :---: |
| 0.10 | 1.5 |
| 0.17 | 2.5 |
| 0.20 | 3.0 |
| 0.24 | 4.0 |
| 0.34 | 5.5 |
| 0.41 | 6.0 |

a) Plot a graph of the potential difference vs. speed.

b) Calculate the slope of your graph. (Include units.)

$$
\text { slope } \approx 0.065 \frac{\mathrm{~V}}{\mathrm{~m} / \mathrm{s}} \cong 0.065 \mathrm{Vs} / \mathrm{m}
$$

c) What is the strength of the magnetic field?

$$
\begin{aligned}
\varepsilon & =B \ell v \\
\therefore \text { slope } & =B \ell \\
\therefore B & =\frac{\text { slope }}{\ell} \\
& =\frac{0.065}{0.15} \\
& \cong 0.43 \mathrm{~T}
\end{aligned}
$$

9. A crate is being accelerated across a rough concrete floor by a rope as shown in position 1 below. It is noticed that when the rope is lifted to a small angle $\theta$ as shown in position 2 the acceleration of the crate increases ( $F$ remains the same).

Using principles of physics, explain why this is the case.

The pulling force in position 2 has a vertical component ( 1 mark) which balances a portion of $F_{g}$ ( 1 mark), leaving $F_{N}$ and therefore $F_{f r}$ reduced ( 1 mark ). The horizontal component of $F$ is changed very little from 1 to 2 ( 1 mark).
