## 1. (5 marks)

A projectile is launched from a cliff top at $20 \mathrm{~m} / \mathrm{s}, 35^{\circ}$ above the horizontal as shown below. The projectile hits the ground 3.7 s after it is launched.

Determine the height of the cliff $\left(d_{y}\right)$ and the range $\left(d_{x}\right)$ of the projectile.

$$
\begin{aligned}
& d_{y}=\left(20 \sin 35^{\circ}\right) 3.7+\frac{1}{2}(-9.8) 3.7^{2} \leftarrow \mathbf{2} \text { marks } \\
& d_{y}=-25 \mathrm{~m}
\end{aligned}
$$

height of cliff $=25 \mathrm{~m}$
$\leftarrow \mathbf{1}$ mark

Note to markers: Accept positive or negative answer.

$$
\begin{array}{ll}
d_{x}=\left(20 \cos 35^{\circ}\right) 3.7 & \leftarrow \mathbf{1} \text { mark } \\
d_{x}=61 \mathrm{~m} & \leftarrow \mathbf{1} \text { mark }
\end{array}
$$

## 2. (5 marks)

A 4.0 m long steel beam is supported 3.0 m from a hinge by a cable attached as shown.

If the tension in the cable is 150 N what is the mass of the steel beam?

$$
\Sigma \tau_{A}=0
$$

$\therefore 150 \sin 40^{\circ} \cdot 3.0=F_{g} \cdot \sin 65^{\circ} \cdot 2.0$
$\leftarrow \mathbf{3}$ marks
$\therefore 150 \mathrm{~N} \cdot \sin 40^{\circ} \cdot 3.0 \mathrm{~m}=m \cdot 9.8 \mathrm{~N} / \mathrm{kg} \cdot \sin 65^{\circ} \cdot 2.0$

$$
\begin{aligned}
\therefore m & =\frac{150 \mathrm{~N} \cdot \sin 40^{\circ} \cdot 3.0 \mathrm{~m}}{9.8 \mathrm{~N} / \mathrm{kg} \cdot \sin 65^{\circ} \cdot 2.0 \mathrm{~m}} & \leftarrow \mathbf{1} \text { mark } \\
& =16 \mathrm{~kg} & \leftarrow \mathbf{1} \text { mark }
\end{aligned}
$$

## 3. (6 marks)

A proton at rest 1.0 m from a fixed $5.0 \mu \mathrm{C}$ charge is released as illustrated.

Calculate the speed of the proton when it is 3.0 m from the fixed charge.

$$
\begin{array}{rlrl}
E_{p_{1}} & =E_{p_{2}}+E_{k_{2}} & & \leftarrow \mathbf{1} \text { mark } \\
\frac{k q Q}{r_{1}} & =\frac{k q Q}{r_{2}}+\frac{1}{2} m v^{2} & & \leftarrow \mathbf{1} \text { mark } \\
\frac{9.00 \times 10^{9}\left(1.6 \times 10^{-19}\right)\left(5.0 \times 10^{-6}\right)}{1.0} & =\frac{9.00 \times 10^{9}\left(1.6 \times 10^{-19}\right)\left(5.0 \times 10^{-6}\right)}{3.0}+0.5\left(1.67 \times 10^{-27}\right) v^{2} & \leftarrow \mathbf{1} \text { mark } \\
7.2 \times 10^{-15} & =2.4 \times 10^{-15}+8.35 \times 10^{-28} v^{2} & & \\
v & =2.4 \times 10^{6} \mathrm{~m} / \mathrm{s} & \leftarrow \mathbf{1} \text { mark }
\end{array}
$$

A deuteron (charge $+e$, mass $2 m_{p}$ ) is placed at the same starting position as the proton.
Explain why the speed of the deuteron at the 3.0 m mark is different than that of the proton.

The deuteron will have the same kinetic energy as the proton. (1 mark)
Because it has a larger mass than the proton, it has a smaller speed. (1 mark)

## 4. (5 marks)

A proton travelling at a high velocity enters a 0.45 T magnetic field and travels in a circular path of radius 0.28 m as shown.

What is the kinetic energy of the proton?

$$
\begin{array}{rlrl}
F_{c} & =F_{B} & & \\
\frac{m v^{2}}{R} & =q v B & & \leftarrow \mathbf{1} \text { mark } \\
\frac{m v}{R} & =q B & & \\
\frac{1.67 \times 10^{-27} v}{0.28} & =\left(1.6 \times 10^{-19}\right)(0.45) & & \leftarrow \mathbf{1} \text { mark } \\
v & =1.2 \times 10^{-7} \mathrm{~m} / \mathrm{s} & & \leftarrow \frac{1}{2} \text { mark } \\
E_{k} & =\frac{1}{2} m v^{2} & & \\
& =\frac{1}{2} \times 1.67 \times 10^{-27} \times\left(1.2 \times 10^{7}\right)^{2} & \leftarrow \frac{1}{2} \text { mark } \\
& =1.2 \times 10^{-13} \mathrm{~J} & & \leftarrow \mathbf{1} \text { mark }
\end{array}
$$

## 5. (5 marks)

A force $(F)$ was used to pull a wooden block across a floor as shown below.

The size of the force was varied and the data table below shows the size of the force and the block's resulting acceleration.

| $F(\mathrm{~N})$ | $a\left(\mathrm{~m} / \mathrm{s}^{2}\right)$ |
| :---: | :---: |
| 20 | 0.25 |
| 25 | 0.85 |
| 30 | 1.35 |
| 35 | 1.95 |

Plot the data on the graph below and draw a line of best fit. Extend the line back to the ' $y$ ' axis so that you have a $y$-intercept point and determine the slope of the line.

(1 mark)

$$
\begin{aligned}
\text { slope } & =\frac{10 \mathrm{~N}}{1.1 \mathrm{~m} / \mathrm{s}^{2}} \\
& =9.1 \mathrm{~kg} \quad \leftarrow \mathbf{2} \mathbf{~ m a r k s}
\end{aligned}
$$

Using your slope value and your $y$-intercept value from the graph, determine the coefficient of friction between the block and the floor.

$$
\begin{aligned}
F-F_{f r} & =m a \\
F & =m a+F_{f r} \\
y \text {-intercept } & =F_{f r}=17.5 \mathrm{~N} \\
\text { slope } & =\text { mass }=9.1 \mathrm{~kg} \\
17.5 & =\mu m g \\
17.5 & =\mu(9.1) 9.8 \quad \leftarrow \mathbf{1} \text { mark } \\
\mu & =0.20 \quad \leftarrow \mathbf{1} \text { mark }
\end{aligned}
$$

## 6. (4 marks)

A student initially sets up a circuit containing two resistors and a light bulb, as shown.

The student notes the brightness of the light bulb. Using principles of physics, explain what happens to the brightness of the light bulb when resistor $R_{2}$ is removed.

Removing $R_{2}$ increases the resistance of the circuit ( 1 mark).
The current through the circuit is therefore decreased ( 1 mark).
There is therefore a reduced voltage drop across $R_{1}$ ( 1 mark).
Therefore the voltage drop across the bulb is increased and therefore brighter $\left(P=V^{2} / R\right)$ (1 mark).
